# Facebook SDK for Python Documentation

Release 3.0.0-alpha

**Martey Dodoo** 

# Contents

1	Installation					
	1.1	Installing from Git	1			
	1.2	Installing a Released Version				
2	Integ	grating the SDK with Other Frameworks	3			
	2.1	Flask	3			
	2.2	Google App Engine	3			
	2.3	Tornado	3			
3	Supp	oort & Development	5			
	3.1	Mailing List	5			
	3.2	Reporting Bugs				
4	API	Reference	7			
	4.1		7			
5	Changelog		13			
	5.1	Version 3.0.0 (unreleased)	13			
	5.2	Version 2.0.0 (2016-08-08)				
	5.3	Version 1.0.0 (2016-04-01)				
	5.4	Version 0.4.0 (2012-10-15)				
	5.5	Version 0.3.2 (2012-07-28)				
	5.6	Version 0.3.1 (2012-05-16)				

Installation

The SDK currently supports Python 2.7, 3.3, 3.4, and 3.5. The requests package is required.

We recommend using pip and virtualenv to install the SDK. Please note that the SDK's Python package is called **facebook-sdk**.

### **Installing from Git**

For the newest features, you should install the SDK directly from Git.

```
virtualenv facebookenv
source facebookenv/bin/activate
pip install -e git+https://github.com/mobolic/facebook-sdk.git#egg=facebook-sdk
```

# **Installing a Released Version**

If your application requires maximum stability, you will want to use a version of the SDK that has been officially released.

virtualenv facebookenv
source facebookenv/bin/activate
pip install facebook-sdk

# Integrating the SDK with Other Frameworks

### Flask

The examples directory contains an example of using the SDK in Flask.

# **Google App Engine**

Because the SDK uses requests (which requires socket support in Google App Engine), you will need to enable billing.

### **Tornado**

The examples directory contains an example of using the SDK in Tornado.

Facebook SDK for Python Documentation, Release 3.0.0-alpha							

Support & Development

# **Mailing List**

Questions about the SDK should be sent to its Google Group.

# **Reporting Bugs**

Bugs with the SDK should be reported on the issue tracker at Github. Bugs with Facebook's Graph API should be reported on Facebook's bugtracker.

### **Security Issues**

Security issues with the SDK that would adversely affect users if reported publicly should be sent through private email to the project maintainer at martey @ marteydodoo.com (GPG key ID is 0x2cd700988f74c455).

Facebook SDK for Python Documentation, Release 3.0.0-alpha						

**API** Reference

This page contains specific information on the SDK's classes, methods and functions.

### class facebook.GraphAPI

A client for the Facebook Graph API. The Graph API is made up of the objects or nodes in Facebook (e.g., people, pages, events, photos) and the connections or edges between them (e.g., friends, photo tags, and event RSVPs). This client provides access to those primitive types in a generic way.

You can read more about Facebook's Graph API here.

#### **Parameters**

- access\_token A string that identifies a user, app, or page and can be used by the app to make graph API calls. Read more about access tokens here.
- timeout A float describing (in seconds) how long the client will be waiting for a response from Facebook's servers. See more here.
- version A string describing the version of Facebook's Graph API to use. The default version is the oldest current version. It is used if the version keyword argument is not provided.
- proxies A dict with proxy-settings that Requests should use. See Requests documentation.
- session A Requests Session object.

#### **Example**

```
import facebook
graph = facebook.GraphAPI(access_token="your_token", version="2.10")
```

#### **Methods**

#### get object

Returns the given object from the graph as a dict. A list of supported objects can be found here.

#### **Parameters**

- id A string that is a unique ID for that particular resource.
- \*\*args (optional) keyword args to be passed as query params

#### **Examples**

```
# Get the message from a post.
post = graph.get_object(id='post_id', fields='message')
print(post['message'])
```

#### get\_objects

Returns all of the given objects from the graph as a dict. Each given ID maps to an object.

#### **Parameters**

- ids A list containing IDs for multiple resources.
- \*\*args (optional) keyword args to be passed as query params

#### **Examples**

```
# Get the time two different posts were created.
post_ids = ['post_id_1', 'post_id_2']
posts = graph.get_objects(ids=post_ids, fields="created_time")

for post in posts:
    print(post['created_time'])
```

```
# Get the number of people attending or who have declined to attend
# two different events.
event_ids = ['event_id_1', 'event_id_2']
events = graph.get_objects(ids=event_ids, fields='attending_count, declined_count')

for event in events:
    print(event['declined_count'])
```

#### search

Returns all objects of a given type from the graph as a dict.

Valid types are: event, group, page, place, placetopic, and user

https://developers.facebook.com/docs/graph-api/using-graph-api#search

Most types require the argument q, except: - place requires q, addres or center - placetopic doesn't require any additional argument

#### **Parameters**

- type A string containing a valid type.
- \*\*args (optional) keyword args to be passed as query params

#### **Example**

```
# Search for a user named "Mark Zuckerberg" and show their ID and name.
users = graph.search(type='user', q='Mark Zuckerberg')

for user in users['data']:
    print('%s %s' % (user['id'], user['name'].encode()))
```

#### get connections

Returns all connections for a given object as a dict.

#### **Parameters**

- id A string that is a unique ID for that particular resource.
- connection\_name A string that specifies the connection or edge between objects, e.g., feed, friends, groups, likes, posts. If left empty, get\_connections will simply return the authenticated user's basic information.

#### **Examples**

```
# Get the active user's friends.
friends = graph.get_connections(id='me', connection_name='friends')
# Get the comments from a post.
comments = graph.get_connections(id='post_id', connection_name='comments')
```

#### get\_all\_connections

Iterates over all pages returned by a get\_connections call and yields the individual items.

#### **Parameters**

- id A string that is a unique ID for that particular resource.
- connection\_name A string that specifies the connection or edge between objects, e.g., feed, friends, groups, likes, posts.

#### put object

Writes the given object to the graph, connected to the given parent.

#### **Parameters**

- parent\_object A string that is a unique ID for that particular resource. The parent\_object is the parent of a connection or edge. E.g., profile is the parent of a feed, and a post is the parent of a comment.
- connection\_name A string that specifies the connection or edge between objects, e.g., feed, friends, groups, likes, posts.

#### **Examples**

#### put comment

Writes the given message as a comment on an object.

#### **Parameters**

- object\_id A string that is a unique id for a particular resource.
- message A string that will be posted as the comment.

#### Example

```
graph.put_comment(object_id='post_id', message='Great post...')
```

#### put\_like

Writes a like to the given object.

#### **Parameters**

• object\_id - A string that is a unique id for a particular resource.

#### **Example**

```
graph.put_like(object_id='comment_id')
```

#### put\_photo

https://developers.facebook.com/docs/graph-api/reference/user/photos#publish

Upload an image using multipart/form-data. Returns JSON with the IDs of the photo and its post.

#### **Parameters**

- image A file object representing the image to be uploaded.
- album\_path A path representing where the image should be uploaded. Defaults to /me/photos which creates/uses a custom album for each Facebook application.

#### **Examples**

#### delete object

Deletes the object with the given ID from the graph.

#### **Parameters**

• id - A string that is a unique ID for a particular resource.

#### **Example**

```
graph.delete_object(id='post_id')
```

#### auth\_url

https://developers.facebook.com/docs/facebook-login/manually-build-a-login-flow

Generates Facebook login URL to request access token and permissions.

#### **Parameters**

- app\_id integer Facebook application id that is requesting for authentication and authorisation.
- canvas\_url string Return URL after successful authentication, usually parses returned Facebook response for authorisation request.
- perms list List of requested permissions.

#### **Example**

#### Facebook SDK for Python Documentation, Release 3.0.0-alpha

```
app_id = 1231241241
canvas_url = 'https://domain.com/that-handles-auth-response/'
perms = ['manage_pages','publish_pages']
fb_login_url = graph.auth_url(app_id, canvas_url, perms)
print(fb_login_url)
```

#### get permissions

https://developers.facebook.com/docs/graph-api/reference/user/permissions/

Returns the permissions granted to the app by the user with the given ID as a set.

#### **Parameters**

• user\_id - A string containing a user's unique ID.

#### **Example**

```
# Figure out whether the specified user has granted us the
# "public_profile" permission.
permissions = graph.get_permissions(user_id=12345)
print('public_profile' in permissions)
```

### Changelog

# Version 3.0.0 (unreleased)

- Remove support for Python 2.6.
- Add support for Graph API versions 2.8, 2.9, and 2.10.
- Remove support for Graph API versions 2.1, 2.2, and 2.3.
- Change default Graph API version to 2.4.
- Add support for requests' sessions (#201).
- Add versioning to access token endpoints (#322).
- Add new *get\_all\_connections* method to make pagination easier (#337).
- Add new get\_permissions method to retrieve permissions that a user has granted an application (#264, #342).
- Remove *put\_wall\_post* method. Use *put\_object* instead.
- Add search method (#362).

## Version 2.0.0 (2016-08-08)

- Add support for Graph API versions 2.6 and 2.7.
- Remove support for Graph API version 2.0 and FQL.
- Change default Graph API version to 2.1.
- Fix bug with debug\_access\_token method not working when the GraphAPI object's access token was set (#276).
- Allow offline generation of application access tokens.

### Version 1.0.0 (2016-04-01)

- Python 3 support.
- More comprehensive test coverage.
- Full Unicode support.
- · Better exception handling.
- Vastly improved documentation.

### Version 0.4.0 (2012-10-15)

- Add support for deleting application requests.
- Fix minor documentation error in README.
- Verify signed request parsing succeeded when creating OAuth token.
- Convert README to ReStructuredText.

### Version 0.3.2 (2012-07-28)

- Add support for state parameters in auth dialog URLs.
- Fixes bug with Unicode app secrets.
- Add optional timeout support for faster API requests.
- Random PEP8 compliance fixes.

# Version 0.3.1 (2012-05-16)

- Minor documentation updates.
- Removes the develop branch in favor of named feature branches.

This client library is designed to support the Facebook Graph API and the official Facebook JavaScript SDK, which is the canonical way to implement Facebook authentication. You can read more about the Graph API by accessing its official documentation.
